Evaluating the Quality, Usability, and Fitness of Open Health Data:

A Systematic Review of Open Data Objects on Federal, State, and Local Platforms

> Erika Martin, PhD MPH Jennie Law, MPA Weijia Ran, MPhil Natalie Helbig, PhD MPA Guthrie Birkhead, MD MPH

Prepared for Thursday Policy Lunch, University at Albany Albany, NY September 18, 2014

Acknowledgements

- Funding from the Robert Wood Johnson Foundation's Public Health Services & Systems Research Program (grant ID #71597 to Martin and Birkhead)
- Early feedback from: Courtney Burke, Patricia Lynch, Theresa Pardo, Ozlem Uzuner
- JSON technical support from: Chris Kotfila

Agenda

- Open data background
- Research questions
- Research methods
 - Overview
 - Sampling
 - Coding instrument
- Preliminary findings
- Next steps

Open data background

- New source of information for public health research
 - □ Martin, Helbig, Birkhead J Public Health Manag Pract 2014
- Motivated by government transparency movement, including President Obama's memorandum on open government
- Thousands of government datasets released on open data platforms at federal, state, and local levels meeting several "openness" criteria
 - Publicly accessible, available in non-proprietary formats, free of charge, unlimited use and distribution rights
- New opportunities for public health research and practice
 - □ New York State examples in Martin, Helbig, Shah JAMA 2014

Challenges and resources for developers

Developer's Corner

HealthGrades Leverages CMS Data to Rate Hospitals in New Report

By Steven Randazzo On Monday, November 5, 2012 - 9:58am

Recently featured in USA Today, a new report by Health-Grubes examines hospital performance at the state level for the first me. The newly released report looks at hospitals from 2005 – 2011 and grades them based on their performance in four categories: Coronary artery typass graft, heart attack, pneumonia, and sepsis. States with the best performing hospitals were raked higher than average in all four categories. The highest rated states were Arizona, California, Illineis and Ohio and the worst inded states were Arizona, Georgia, Nevoda, Oklahoma, the District of Columbia and West Virginia.

Healthgrades analyzed the Centers for Medicare and Medicaid's (CMS) Hospital Compare Data to determine which hospitals had the bestworst performance. Hospital compare includes process of care, montality, and readmission quality measures. Read more s

HealthData.gov 1.1 Patch Notes

By David Forrest On Wednesday, October 17, 2012 - 11,46am

Developer's Corner

HHS hopes HealthData.gov will become a useful hub for developers using government data to improve health. This Developer Corner will become a space for us to highlight uses of health data and to discuss how developers can improve access to the HealthData.gov data catalog.

There are three parts to the developer corner.

Seven complementary developer challenges,
 The HealthData.gov API,
 The source code for this site.

payers by the patient's county.

HealthData.gov Develone

You're brilliant, talented, and full of great ideas, right? Share them! How can we drive better health outcomes through the innovative use of data? How can we improve this site? Let's brainstorm together!

Share Idea

Note: Only ideas specifically related to HealthData.gov will be considered. Please do not submit any personally identifiable information such as your email address, name, social security number, or home address. Thanks!

Research questions

- Open data are promising but...
- To what extent are open health data usable and fit for public health research?
- How could government agencies improve the quality of the data and corresponding metadata, to make these data more usable and fit for public health researchers and practitioners?

Research design overview

- Systematic review of open health data objects on federal, state, and local platforms
 - Adapted from Institute of Medicine and Patient-Centered Outcomes Research Institute guidelines for systematic literature reviews
- Health-related data objects randomly sampled from three platforms
 - Healthdata.gov (federal)
 - Health Data NY (state)
 - NYC Open Data (city)
- □ All data objects examined using a coding guide to evaluate:
 - Data quality (intrinsic, contextual)
 - Metadata quality
 - Platform usability

Sampling design

Final selection

- □ All NYC Open Data objects related to health (N=37)
- 25% simple random sample of Health Data NY data objects (N=71, of 308 available)
- 5% simple random sample of Healthdata.gov data objects (N=75, of 1,526 available)
- Total of 183 data objects

Sampling methods

- □ Scraped metadata from three platforms into three Excel spreadsheets
- Used Excel-based random number generator to assign random integer values from 1 to N, then selected every dataset assigned a 1

Development of coding guide

 Cross-disciplinary literature review to develop a preliminary conceptual framework of data quality, usability, and fitness

□ Stakeholder conversations to refine conceptual framework

- Respondents: experts in computer science/semantic web (1) and data quality (2); academic health researchers (3); local epidemiologists (3); analysts at health policy and advocacy center (2)
- Topics covered: how health data are used; which health datasets are useful; how respondents decide whether a dataset is of high quality, usable, and fit; metadata needed to evaluate datasets; comments on conceptual framework
- Internal vetting with interdisciplinary research team

Development of coding guide, cont.

- Additional stakeholder input on the quality, usability, and fitness of data for health research obtained from:
 - Focus groups of public health researchers and practitioners, conducted at November 2013 open data workshop in Albany, NY (Martin, Helbig, Birkhead J Public Health Manag Pract 2014)
 - Blog post to NYSDOH SAS user group to solicit comments
 - Review of stakeholder feedback comments on the Prevention Agenda dashboard
 - Review of a sample of data-based County Health Assessments
 - □ Grant reviewers' feedback

Extensive pilot-testing and refinement

Characteristics of Data Use

Data Characteristics

- Populations represented
- Sample size and sampling methods
- Unit of analysis
- Data elements included
- Data collection method
- Study design
- Data collection timing and frequency
- Data format and layout
- Amount and type of missing data
- Procedures to annotate dataset

Data User Characteristics

- Subject matter expertise
- Technical skills
- Types of tasks performed
- Intended use

Platform Promotion and User Training

- Policies, regulations, and data stewardship
- Legal interpretation of confidentiality protections
- Political support for developing and releasing data
- Capacity to respond to user feedback
- Financial resources
- Value propositions for releasing data
- Availability of information technology
- Platform advertising, promotion, and user training

Data Quality and Usability

Intrinsic Data Quality

- Accuracy+
- Believability/Reputation+
- Objectivity/Reliability+
- Confidentiality+
- Validity

Contextual Data Quality

- Relevancy+
- Value-added*
- Timeliness+
- Completeness*
- Appropriate amount of data*
- Ease of understanding+
- Ease of manipulation*
- Concise representation

Platform Usability

- Accessibility*
- Representational consistency*
- Functionality*
- User-friendliness*
- Learnability*
- Visibility*

Metadata Quality

- Completeness*
- Interpretability^
- Accuracy^
- Provenance+
- Consistency*
- Timeliness
- Conformance to expectations

Health Impacts

Short-Term Impacts

- Research studies completed
- · Research grants obtained
- Development of mobile health
 applications
- Data-driven population health planning and monitoring
- Availability of health information
- Empowerment of healthcare consumers

Long-Term Impacts

- Quality of medical and public health services
- Value of medical and public health services
- Health status of patients and populations
- Improved decisionmaking by patients, providers, and policymakers

Legend

- * Coding instrument contains at least one item to directly assess
- + Coding instrument contains at least one item to indirectly assess (e.g. "is there a clearly identified limitations section?" as a component of intrinsic data)
- ^ Assessed using narrative comments

Example of coding guide questions

- □ Contextual data quality ease of manipulation
 - What is the data object's primary presentation format (table, chart, map, external file, API, filter, other)?
 - □ If primary format is a visualization, are simple statistics available?
 - Are there different presentation formats for the data object (if so, list available formats)?
 - Can the data be downloaded from the platform (if so, what download options are available)?
 - Can the data be downloaded from the data access page (if so, what download options are available)?
 - □ Are the data available as structured data?
 - Are the data available in non-proprietary formats?
 - □ Is the selection a data artifact?
 - □ Is the data object viewable in a browser (if no, why not)?

Example of coding guide questions, cont.

- □ Intrinsic data quality accuracy/objectivity/reliability
 - □ Is a limitations section clearly and explicitly identified?*
 - □ Is there a codebook or data dictionary?
 - □ Is any information about the purpose of the data collection listed?*
 - □ Is there a description of the sample design?*
 - □ Is there a description of how the data were collected?*
 - □ Is the data collection instrument available?*
 - Is there any notation about random checks for data accuracy, auditing procedures, validity checks, etc.?*
 - Is there any notation about the data preparation/processing steps that happened as the data were transformed into open data?*

* if yes, coders copy and paste relevant text

Example of coding guide questions, cont.

- Contextual data quality relevancy/value-added
 - □ Is there a data object description?*
 - □ Is the granularity clearly and specifically identified?*
 - □ Is the unit of analysis clearly and specifically identified?*
 - □ Is the data object available via a URI on the metadata page?*
 - □ Are there examples of how data have been used in research/practice?*
 - Does the platform list any ideas for how data could be used?*
 - □ Is there mention of other data objects that would be of interest?*
 - □ Are the data available in RDF format?
 - Do variable names hyperlink to contextual information?
 - Series of questions on presence of demographic, provider, and health facility variables, and their response categories
 - Demographics: age, gender, race/ethnicity, insurance status, income, education

* if yes, coders copy and paste relevant text

Additional coding guide considerations

- Includes questions to address adherence to international Dublin Core Metadata Standards
- □ Static documents archived on hard drive
 - Codebooks, data dictionaries, dataset downloads, other available materials online
 - Metadata and data access pages saved as complete webpages
- Questions very specific and direct, to improve inter-rater reliability

Data collection procedures

- Extensive pilot-testing of coding guide
 - Purposive selection of 16 data objects from the three platforms which varied widely (e.g. administrative vs survey, simple tabular format vs large SAS-file download, small vs large size)
 - □ J.L. and W.R. double-coded and compared responses, discussing discrepancies with E.M.
 - □ Interim feedback from N.H. and G.B.
 - Coding guide continuously updated until uniform agreement
- **Coding guide transformed into Access database for data entry**
 - □ Form view and fixed response categories to minimize data entry errors
 - □ Flags for queries to discuss with the team
- Separate coding guide for platform usability
 - Assessed after object-by-object coding

Limitations

- Smaller N than anticipated
- Limited to fact-based questions (e.g. "is there a clearly identified limitations section?")
 - Subjective nature of data quality, which depends on intended use
 - □ Time constraints limited to a cursory examination of each object
 - Unanticipated finding that many data objects are not tabular datasets
 - (Somewhat anticipated) finding that the three platforms present information in inconsistent formats and locations
- Coding guide does not capture:
 - Representational consistency (platform usability)
 - Metadata consistency (metadata quality)

Characteristics of data objects

	NYC Open	Health Data	
	Data	NY	Healthdata.gov
Characteristic	$(city, N=38)^1$	(state, N=71)	(federal, N=74)
Primary presentation format, % (N) Table Chart Map	21.6% of federal federated from a platform	objects different	16.2 (12) 1.4 (1)
External file	26.3 (10)	12.7(9) 2 8 (2)	36.5 (27)

Data artifact	7.9 (3)		1.4(1) 1.4(1)
Availability of additional presentatio	$\frac{10.5}{n}$	5.6 (4)	32.4 (24)
Availability of data related to visualizations ³ , % (N)	29 (11)	<i>39.2</i> (1 <i>2</i>)	15.5 (10)
Raw data available Simple statistics available	13.1 (5)	47.9 (34) 70.7 (29)	1.4 (1)

Availability of data objects

	NYC Open	Health Data	
	Data	NY	Healthdata.gov
Characteristic	$(city, N=38)^{1}$	(state, N=71)	(federal, N=74)
Ability to view data object in browser,			
% (N)			
Object is viewable in a browser	73.7 (28)	78.9 (56)	36.5 (27)
Problem with the data access page	13.2 (5)	1.4 (1)	6.8 (5)
Data object is an external file	5.3 (2)	18.3 (13)	28.4 (21)
Data object requires subscription or			
registration	2.6(1)		8.1 (6)
Data object is only viewable in a			
proprietary format	2.6 (1)		
Not applicable	2.6 (1)	1.4 (1)	20.3 (15)
Ability to download data, % (N)			
Available via platform		14.1 (10)	
Available via data access page			25.7 (19)
Available from both sources	84.2 (32)	78.9 (56)	31.1 (23)
Not available for download	15.8 (6)	7 (5)	43.2 (32)

Accessibility of data objects relevant for health research

1	NYC Open	Health Data	
	Data	NY	Healthdata.gov
Characteristic	(city, N=38)1	(state, N=71)	(federal, N=74)
Inclusion of demographic variables, %			
(N)			
Age	5.3 (2)	29.6 (21)	24.3 (18)
Gender	5.3 (2)	18.3 (13)	18.9 (14)
Race/ethnicity	5.3 (2)	11.3 (8)	13.5 (10)
Insurance status	5.3 (2)	28.1 (20)	24.3 (18)
Education	5.3 (2)	14 (10)	2.7 (2)
Income	18.4 (7)	7 (5)	10.8 (8)
Geographic identifier	44.7 (17)	63.4 (45)	37.8 (28)
Provider and/or health facilities	47.4 (18)	50.7 (36)	32.4 (24)

Platform usability

Common features

- Hosting data on platforms, with links to external pages where relevant (Health Data NY, NYC Open Data)
- Open data handbooks to guide standardization of metadata (Health Data NY, NYC Open Data)
- Multiple functions to search for and download data objects, post comments and ideas, develop APIs, and announce innovation challenges to engage developers and the public
- □ Help functions such as tutorials, help email address
- Designed to engage the public, with pictures, story boards, ways for users to provide comments

Platform usability

- Interesting features
 - Ability to embed visualizations into external webpages (Health Data NY, NYC Open Data)
 - □ Allowing users to Tweet posts highlighting data (NYC Open Data)
 - Health Data NY has a visible presence in Google (appears in general search for "New York State Department of Health," and on the NYSDOH webpage)
 - Rotating story board with public health messaging, and list of recently added/featured/most viewed datasets (Health Data NY)

Platform usability

- □ Healthdata.gov scores low on many platform usability criteria
 - Accessibility-frequent broken links; all objects hosted on external webpages
 - Representational consistency-no handbook, inconsistent metadata elements
 - □ Functionality- limited interaction with data on the platform
 - User-friendliness- difficult to locate objects due to redirection to other sites
 - Visibility- Healthdata.gov not viewable from a search of "Department of Health & Human Services"; small link to HHS/Open at the bottom of agency webpage

Next steps

- Develop scales to combine items for:
 - Intrinsic data quality
 - Contextual data quality
 - Metadata quality
 - □ Adherence to the Dublin Core metadata standards
- Run additional tests to see how items cluster, to make recommendations on how to improve the instrument for use in future comparative research

Planned research products

- Presentation to NYSDOH, Socrata
- Primary manuscript of main findings
- Data collection tools, to post to project webpage
- Potential commentaries
 - Dimensions of data quality, and how to evaluate whether a dataset is usable and fit for public health research
 - Evolution of the open data movement
 - Ideas for improving the design of open data platforms and presentation of data and metadata

Other project activities

- Key informant interviews with public health practitioners to understand the value propositions of integrating researchers into the open data ecosystem, and barriers to releasing data
- Pilot geospatial analysis of the relationship between childhood obesity and the built environment in NYS, using open data resources
 - Collaboration with Health Data NY team and Socrata
 - Comparison of results from "gold standard data ecosystem" data analysis model to: 1) no interaction with practitioners, and 2) automated platform-based findings

Questions?
