#### Public Health PBRN Monthly Virtual Meeting July 17, 2014

Research-in-Progress Presentation by Connecticut Public Health Practice-Based Research Network

Cost Effectiveness, Efficiency and Equity of Inspection Services throughout Connecticut's Local Public Health System

**Presented by:** 

Patricia J. Checko, DrPH, MPH and Jeffrey Cohen, PhD, University of Hartford

Please remember to mute your telephone/computer speakers during the presentation To mute your telephone press \*6, to unmute #6 Conference Phone: 877-394-0659 Conference Code: 7754838037#

at the University of Kentucky College of Public Health

Cost effectiveness, efficiency and equity of inspection services throughout Connecticut's local public health system

> Patricia J. Checko, DrPH, MPH (Co-PI) Jeffrey P. Cohen, Ph.D. (Co-PI) July 17, 2014

Connecticut Association of Directors of Health

#### **Project Components**

- The project has two components.
  - <u>Component 1</u> describes and analyzes the scope and cost of four environmental health services provided in Connecticut and the differences in associated costs incurred by local health jurisdictions that may arise from differences in the size and structure of local health departments.
    - These services include: <u>food protection, public water wells,</u> <u>subsurface sewage disposal and lead poisoning prevention and</u> <u>control</u>.
  - <u>Component 2</u> evaluates the impact of size and organizational structure relative to a number of hypotheses about the efficiency, effectiveness and equity of food protection services.

# Full and Part-Time Health Departments in Connecticut

	#Towns	Population Percent		Pop. Range		
Full-Time	145	3,374,354	94%			
Municipal	29	1,657,005	46%	18,239 -145,638		
Districts (21)	116	1,717,349	48%	28,194 -166,117		
Part-Time	24	203,491	6%	1,917- 25,729		
TOTAL	169	3,577,845				

Connecticut Association of Directors of Health

## Some Key Questions That Our Cost Functions Can Address

- Are providers "too small" or "too large" ?
- To answer: estimate scale economies
- Is it less costly to "produce" more or less of different types of inspections together?
   (Some jurisdictions don't do all inspections, or only small amounts of some inspections, due to small district size; others considering merging may do more of some – how does this affect the cost of doing others??)
- To answer: estimate economies of scope

Connecticut Association of Directors of Health

#### **Economic Theory of Production and Costs**

Connecticut Association of Directors of Health

Health districts should choose their input mix to balance the benefits of spending more on workers vs. on physical capital

Connecticut Association of Directors of Health

#### Health Districts Should Strive to be at point Y<sub>e</sub>

Average cost (AC) is the cost per unit of output (Y), while marginal cost (MC) is the change in total cost from a small change in output. Figure 3 shows that micro-economic theory implies the provider's AC curve is U-shaped, and the MC curve slopes up. AC is minimized at Ye, so Ye is the "efficient" level of output. If MC<AC (economies of scale), as in the provider output level Ya, then the provider can lower its AC by increasing Y until it reaches Ye.

Connecticut Association of Directors of Health

#### **Economies of Scope and Specialization**

Connecticut Association of Directors of Health

#### **Outputs for Cost Functions**

- Drinking Water:
  - Output:
    number of private well permits +
    number of public well permits

Connecticut Association of Directors of Health

#### **Outputs for Cost Functions (continued)**

Food Services:

Output: Number of inspections
 (in different "classes", including temporary events)

Connecticut Association of Directors of Health

#### **Outputs for Cost Functions (continued)**

• Sewage:

-Outputs: total # of permits = Number of new permits + Number of repair permits + Number tested + Number of B100's (makes sure have space for a workable septic system)

Connecticut Association of Directors of Health

## Outputs for Cost Functions (continued)

• Lead

Output:# of inspections

Connecticut Association of Directors of Health

# **Cost Function Variables**

- Q: Outputs in each category (lead, water, sewer, food)
- P: Price of inputs (average wage for all workers; price index for capital structures)
- X: any nurse staff (yes/no); urban or rural (yes/no); # of patients w/blood lead levels≥10
- D: (D1=municipal health dept, D2=district, 3=part-time)
- t: time trend
- All dollar values are adjusted for inflation

Connecticut Association of Directors of Health

# **Estimating Equation**

Variation of a Translog Total Cost Function:

 $\log(\mathrm{TC}_{\mathrm{it}}) = \log(\mathrm{TC}_{\mathrm{it}}(\mathbf{Q}_{\mathrm{it}}, \mathbf{P}_{\mathrm{it}}, \mathbf{X}_{\mathrm{it}}, \mathbf{t}, \mathbf{D}_{\mathrm{j}})) = \alpha_0 + \alpha_p \log(\mathrm{P}_{\mathrm{Lit}}) \log(\mathrm{P}_{\mathrm{Kit}}) + \alpha_{\mathrm{L}} \log(\mathrm{P}_{\mathrm{Lit}})^2$ 

$$+ \Sigma_m \Sigma_n \delta_{mn} log(Q_{nit}) log(Q_{mit}) + \Sigma_n \delta_n log(Q_{nit})^2 + \Sigma_j \delta_j D_j + \Sigma_r \alpha_r X_{rit} + \gamma t + u_{it}$$

t = 2005, 2006, ..., 2012; i = 1,2,...,75; j = 1 (municipal), 2 (district); (m,n) = water, septic, food, lead; r = (any nurse; urban/rural; blood level  $\geq 10$ ) Parameters to be estimated by least squares regression:  $\alpha$ ,  $\delta$ ,  $\gamma$ ;  $u_{it} \sim N(0, \sigma^2)$ 

CADH

## **Elasticity of Scale**

• Can easily compute scale economies for each (i, t) observation:

With only one output,

 $\epsilon = [\partial TC / \partial Q] [Q / TC]$ =  $\partial \log TC / \partial \log Q$ = MC / AC

If  $\varepsilon >1$ , MC>AC, so AC rising (decreasing returns to scale) If  $0 < \varepsilon <1$ , MC<AC, so AC falling (increasing returns to scale) If  $\varepsilon =1$ , MC=AC (constant returns to scale, or minimum efficient scale)

Connecticut Association of Directors of Health

#### Health Districts Should Strive to be at point Y<sub>e</sub>

Average cost (AC) is the cost per unit of output (Y), while marginal cost (MC) is the change in total cost from a small change in output. Figure 3 shows that micro-economic theory implies the provider's AC curve is U-shaped, and the MC curve slopes up. AC is minimized at Ye, so Ye is the "efficient" level of output. If MC<AC (economies of scale), as in the provider output level Ya, then the provider can lower its AC by increasing Y until it reaches Ye.

Connecticut Association of Directors of Health

Elasticity of Scale and Scope: Total Cost Scale Economies with 4 Outputs (Baumol et al, 1982):

 $\varepsilon = \partial TC/\partial Q_1 \bullet (Q_1/TC) + \partial TC/\partial Q_2 \bullet (Q_2/TC)$ 

+  $\partial TC/\partial Q_3 \bullet (Q_3/TC) + \partial TC/\partial Q_4 \bullet (Q_4/TC)$ 

Scope Economies with 2 or more Outputs:

 $\frac{\partial [\partial \log TC/\partial \log Q_1]}{\partial Q_2} \bullet [TC/Q_1] = \frac{\partial^2 TC}{\partial Q_1} \frac{\partial Q_2}{\partial Q_2} \bullet [TC/Q_1] \\ = [\partial MC_1/\partial Q_2] \bullet [TC/Q_1] < 0$ 

is a sufficient condition:

MC curve for one output drops when more of the other output is produced (weak complementarity, Vita, 1990) (In reverse, could have economies of specialization if > 0)

Connecticut Association of Directors of Health

## **Data and Organizational Issues**

- Annual Report Data: issues include completion rates, completeness and validity of data, changes in data elements
- Missing values for key variables in some years for some districts reduces sample
- Determining appropriate outputs for lead, water and septic

Connecticut Association of Directors of Health

#### Economies of Scope or Specialization

- By doing more inspections of one type, how does that affect the incremental costs of other types of inspections?
- Can be important to understand when considering merging or sharing services
- If > 0, more of an output increases MC of another output (economies of specialization)
- If < 0, more of an output decreases MC of another output (economies of scope)

Connecticut Association of Directors of Health

#### Economies of Scope or Specialization

- Water and Septic: <0
- Water and Lead: >0
- Water and Food: >0
- Food and Lead: <0
- Food and Septic: <0
- Lead and Septic: <0

Connecticut Association of Directors of Health

#### **Economies of Scope - Interpretations**

- <0 cost savings for mergers when two jurisdictions focus on different outputs (economies of scope)
- >0 cost savings for *not* merging when two jurisdictions focus on different outputs (economies of specialization)
- e.g., district A does many food inspections, few others; district B does many lead inspections, few others.
- If <0, cost savings from merging or sharing resources
- If >0, cost savings from not merging/sharing

Connecticut Association of Directors of Health

## Limitations

- Data !!!
- Economies of scale: depend on small changes in output;
- Economies of scope: assumes hold all other types inspections constant (difficult to compare 3 types of inspections, but pair-wise comparisons more relevant)
- Many municipal health departments and districts offer other services; we only control for environmental health outputs, so output may be understated – perhaps they are further down on AC curve than we have found

Connecticut Association of Directors of Health

# Summary of policy implications

- Drawbacks from merging or sharing resources:
  - Elasticity of scale assumes small changes
  - Some jurisdictions may be experiencing economies of specialization for some outputs
- Benefits to merging or sharing resources:
  - Economies of scale to be gained for merging small jurisdictions (such as part-timers)
  - Some jurisdictions may benefit from economies of scope for some outputs

Connecticut Association of Directors of Health

## **Conclusions and Future Research**

- Supplemental survey to annual reports
- Hope to obtain information for calculating unit costs
- Focus groups for component 2
- Key informant interviews for component
  2

Connecticut Association of Directors of Health

### **Other Meeting Agenda Items**

#### **PBRN Research Updates**

- Kudos to PBRN presenters at the NACCHO meeting
- MPROVE/DACS panel APHA, Tuesday, November 18 10:30am-12:00pm
- DIRECTIVE recommendations to RWJF
- Quick Strike: final reviews
- Please submit AcademyHealth and NACCHO Presentations as grant products
- Grantee Meeting in Lexington, KY August 11-12,2014 (Monday-Tuesday)
- AcademyHealth Scholarship recipients teach-back August 21
- Collaboration with <u>J-PAL</u> on pragmatic randomized control trials in PH settings

#### **Dissemination Opportunities**

- 7<sup>th</sup> Annual Conference on the Science of Dissemination and Implementation in Health, AcademyHealth and NIH Dec 8-9, 2014. Bethesda, MD. Registration in early August- PHSSR/PBRN panel. <u>Abstracts due August 8</u>
- Please advise of upcoming conference presentations and/or practice or policy translations that you are planning

#### **Funding Opportunities**

• RWJF PHSSR 2014 Solicitation: Closes July 23, 2014

#### **Questions and Wrap up**

- Next Month's Virtual Meeting- August 21
  - Research-in-progress: Colorado Public Health PBRN
  - AcademyHealth ARM and IG Teach-Backs: AcademyHealth Pubic Health PBRN Scholarship Recipients

#### **Presentation schedule**

#### **Presentation Schedule for 2014**

January 16 Tennessee PBRN February 20 Nebraska PBRN March 20 North Carolina PRBN May 15 New York PBRN June 19 California PBRN July 17 Connecticut PBRN August 21 Colorado PBRN September 18 Ohio PBRN October 16 New Jersey PBRN November 20 Washington PBRN December 18 New Hampshire PBRN
